Automation Server

SERVER 35000

Automation Servers provide connectivity functions to concurrently integrate CEA 709 (LonMark Systems), BACnet, KNX, Modbus, and M Bus subsystems. LonMark Systems can be integrated via IP 852 (Ethernet/ IP) or TP/ FT 10. BACnet integration is supported through BACnet/ IP (Ethernet/ IP) or BACnet MS/ TP (RS 485). Automation Servers feature an integrated Remote Network Interface (RNI) to access the TP/ FT 10 channel on the device via Ethernet/ IP. Automation Servers feature two built-in routers, one IP 852 router and one BACnet/ IP to MS/ TP router including BBMD as well as Slave-Proxy functionality providing the complete feature set of the corresponding IP devices.

The automation servers implement the BACnet Building Controller (B-BC) profile and are BTL certified. In addition, the automation server provide connectivity to KNXnet/ IP and Modbus TCP via Ethernet/ IP and to Modbus RTU via RS 485. M Bus and KNX TP1 device integration

The gateway functionality allows data communication between all communication technologies available on the device. Different technology data points are mapped through Local Connections on the device. The mapping of different technology data points on distributed devices is supported by Global Connections. Automation Servers also support Smart Auto-Connect™ – the automatic generation of connections to substantially reduce engineering efforts and cost. All technology data points are automatically created as OPC XML DA and OPC UA data points.

Automation Server is equipped with two Ethernet ports. It can either be configured to use the internal switch to interconnect the two ports or every port is configured to work in a separate IP network.

When the Ethernet ports are configured for two separate IP networks, one port can be connected for instance to a WAN (Wide Area Network) with enabled network security (HTTPS) while the second port can be configured to be connected to an insecure network (LAN) where the standard building automation protocols like BACnet/ IP, LON/ IP, or Modbus TCP are present. These devices also feature firewall functionality of course to isolate particular protocols or services between the ports.

Using the internal switch, a daisy chained line topology of up to 30 devices can be built, which reduces costs for network installation. The IP switch also allows the setup of a redundant Ethernet installation (ring topology), which increases reliability. The redundant Ethernet topology is enabled by the Rapid Spanning Tree Protocol (RSTP), which is supported by most managed switches.

The automation server manages user-specific graphical pages with dynamic content for the visualization of information. The visualization of dynamic graphical pages is carried out by HTML5 PC Application or HTML5 in Web browser on one or more PCs or mobile devices. The automation server can also be integrated in the Building Management System. For the dynamic visualization of information, no additional browser plug-in is required. SSL-encrypted web services (OPC XML-DA) are used to access the data. Per Automation Server, multiple graphical applications can exist in parallel. The automation server can be accessed over an IP connection by several users simultaneously.

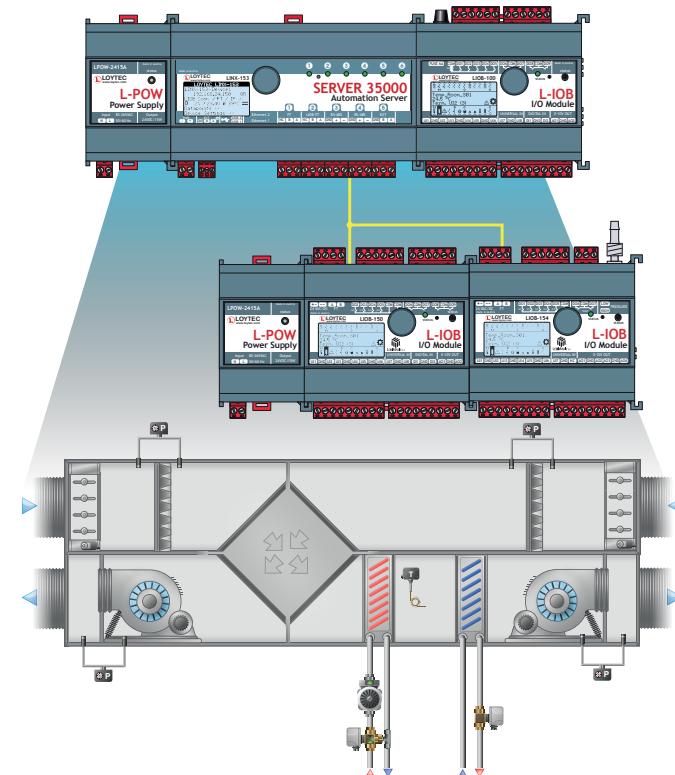

The automation server features scheduling, alarming, and trending. These functions are also accessible via the graphical user interfaces, or the Building Management System. Additionally, the user can access schedules and alarm lists via the integrated web server.

An event-driven e-mail notification, as the result of a predefined action, informs about the operating status. The e-mail text can be freely designed. The placement of dynamic values in the text is possible. Stored trend data (CSV file) can be forwarded as attachment.
